

Project Title: Student Enrollment & Course Management System

User story:

The Student Enrollment & Course Management System allows students to register, log in, view available courses, enroll in selected courses, update their personal details, and track their enrollment status. Administrators can manage student records, add and update course details, assign faculty members, monitor enrollments, and generate reports. Faculty members can log in, view their assigned courses, access student enrollment details, and manage course-related information. The system aims to simplify the enrollment process, maintain accurate student and course records, reduce manual paperwork, and provide an efficient platform for managing academic activities. It also ensures easy access to information through a user-friendly interface. Overall, the system improves communication between students, faculty, and administrators while supporting organized academic management.

1. Brainstorming & Ideation Phase

1.1 Introduction

The brainstorming and ideation phase is the initial stage of the software development process, where different ideas, concepts, and possible solutions are identified and analyzed to develop an effective system. This phase focuses on understanding the existing problems, identifying user requirements, and generating innovative ideas to improve the student enrollment and course management process.

The Student Enrollment & Course Management System is designed to simplify and automate the activities involved in student registration, course management, and enrollment. In many educational institutions, student information and course enrollment details are maintained using manual records, spreadsheets, or separate systems. These methods may result in data duplication, paperwork, delays, and difficulties in retrieving information.

During the brainstorming phase, the project team explored various ideas to overcome these challenges and develop a centralized system that provides an organized and user-friendly platform for students and administrators.

The main purpose of this phase is to identify the essential features, determine the system's objectives, and establish a clear direction for the development of the proposed application.

1.2 Identification of Existing Problems

The first step in the brainstorming process was to identify the difficulties faced by students and administrative staff during traditional enrollment and course management activities.

The following problems were identified:

1. Manual Student Registration

In traditional systems, students may need to fill out physical registration forms and submit them to the administrative department. This process requires additional time and effort for both students and staff.

2. Difficulty in Managing Course Information

Maintaining course details manually makes it difficult to update course names, descriptions, eligibility criteria, and other academic information regularly.

3. Data Duplication and Errors

Manual data entry may lead to incorrect student details, duplicate records, missing information, and inconsistencies in enrollment records.

4. Time-Consuming Enrollment Process

Students may need to visit the administrative office to obtain course information and complete enrollment procedures, resulting in delays and unnecessary workload.

5. Difficulty in Retrieving Records

Searching for student details, course information, and enrollment history from physical files or multiple spreadsheets can be difficult and time-consuming.

6. Lack of Centralized Information

When student and course information is stored in separate locations, maintaining accurate and updated records becomes challenging.

7. Limited Enrollment Tracking

Without a centralized system, monitoring student enrollment status and identifying enrolled courses may require additional manual effort.

These problems highlighted the need for a digital solution that can organize student and course information in a structured and accessible manner.

1.3 Idea Generation

After identifying the existing problems, different ideas were generated to improve the enrollment and course management process.

The primary idea was to develop a web-based application that allows students and administrators to perform their respective activities through a single platform.

The following ideas were considered:

- Creating a digital student registration form.
- Developing a centralized student database.
- Providing an interface to display available courses.
- Allowing students to select and enroll in courses.
- Creating an administrative dashboard for managing student records.
- Providing facilities to add, edit, and remove course information.
- Maintaining enrollment records in a structured database.
- Displaying enrollment details for easy reference.
- Implementing input validation to reduce incorrect data entry.
- Designing a simple and user-friendly interface.
- Providing organized access to student and course information.

These ideas were evaluated based on their usefulness, implementation feasibility, and relevance to the project objectives.

2. Requirement Analysis Phase

2.1 Introduction

The Requirement Analysis Phase is an important stage in the Software Development Life Cycle (SDLC). It involves identifying, collecting, analyzing, and documenting the requirements of the proposed system. This phase helps determine what the system should do, how it should operate, and what features are necessary to satisfy the needs of its users.

The Student Enrollment & Course Management System is designed to simplify student registration, course administration, and enrollment activities through a centralized digital platform. The requirement analysis focuses on understanding the needs of students and administrators and identifying the functional and non-functional requirements of the application.

In traditional educational institutions, student enrollment and course information are often maintained through paper-based records or separate digital files. These methods may cause delays, data duplication, difficulties in retrieving information, and increased administrative workload.

To overcome these challenges, the proposed system aims to provide an organized platform where students can register, view available courses, and enroll in courses, while administrators can manage student records, course details, and enrollment information.

The requirement analysis phase establishes the foundation for designing and developing a reliable, user-friendly, and efficient system.

2.2 Objectives of Requirement Analysis

The main objectives of the requirement analysis phase are:

1. To identify the needs and expectations of students and administrators.
2. To understand the problems associated with the existing enrollment process.
3. To define the functional requirements of the proposed system.
4. To identify the non-functional requirements related to performance, security, usability, and reliability.
5. To determine the hardware and software requirements.

6. To identify the data required for student registration and course management.
7. To establish the system's scope and limitations.
8. To ensure that the proposed system meets the academic and administrative requirements.

2.3 Requirement Gathering Methods

Requirement gathering is the process of collecting information necessary for developing the proposed application. The following methods were considered during the requirement analysis.

1. Observation

The existing student registration and course management activities were considered to understand the difficulties involved in maintaining records manually.

Observation helps identify repetitive tasks, paperwork, and challenges in retrieving student and course information.

2. Existing System Analysis

The traditional enrollment process was analyzed to identify its limitations and determine the improvements required in the proposed system.

The analysis focused on student registration, course selection, record maintenance, and enrollment tracking.

3. User Requirement Identification

The requirements of the two primary users, students and administrators, were identified.

Students require a simple interface for registration, course viewing, and enrollment, while administrators require facilities to manage student details, courses, and enrollment records.

4. Functional Requirement Identification

The necessary system operations were identified and organized into modules to support systematic development.

2.4 User Requirements

The proposed system consists of two primary user categories.

A. Student Requirements

Students should be able to:

- Register by entering personal and academic details.
- Log in using their registered credentials.
- View available courses.
- Access course names, codes, and descriptions.
- Select and enroll in available courses.
- View their enrolled course details.
- Access their registration information.
- Receive appropriate confirmation or validation messages.

B. Administrator Requirements

Administrators should be able to:

- Log in to the administrative section.
- View registered student details.

- Add new courses to the system.
- Update existing course information.
- Delete courses when required.
- View student enrollment records.
- Manage student and course information.

2.6 Non-Functional Requirements

- Non-functional requirements describe the quality attributes and operational characteristics of the system.
- 1. Usability
 - The application should provide a simple and user-friendly interface that can be easily understood by students and administrators.
- 2. Performance
 - The system should respond efficiently to common operations such as login, course viewing, student registration, and enrollment.
- 3. Security
 - The system should protect user credentials and restrict administrative functions to authorized users.
- 4. Reliability
 - The system should maintain accurate student, course, and enrollment records during normal operation.
- 5. Maintainability
 - The application should be organized into separate modules so that modifications and future improvements can be implemented easily.

3.Project Design Phase

3.1 Introduction

The Project Design Phase is an important stage in the Software Development Life Cycle (SDLC), where the requirements identified during the analysis phase are converted into a structured system design. This phase defines how the proposed application will function, how its components will interact, how information will be stored, and how users will access its features.

The Student Enrollment & Course Management System is designed to provide a centralized platform for managing student registration, course information, and enrollment records. The design phase focuses on developing a clear architecture, organizing system modules, planning the database structure, and designing a user-friendly interface.

The main objective of this phase is to establish a blueprint for implementation. It ensures that the system is organized, easy to understand, maintainable, and capable of fulfilling the requirements of students and administrators.

The proposed system follows a modular design approach, where each major function is developed as a separate module. This approach improves the organization of the application and makes future modifications easier.

3.2 Objectives of the Project Design Phase

The main objectives of the design phase are:

1. To define the overall architecture of the proposed system.
2. To identify the major modules and their responsibilities.
3. To design a simple and user-friendly interface.

4. To develop a structured database for storing student, course, and enrollment information.
5. To define the relationships between different data entities.
6. To establish the interaction between students, administrators, and the system.
7. To ensure data consistency and accuracy.
8. To prepare a clear blueprint for the implementation phase.

3.3 System Architecture Design

System architecture describes the overall structure of the application and explains how its major components interact with one another.

The Student Enrollment & Course Management System follows a layered architecture consisting of the presentation layer, application layer, and database layer.

1. Presentation Layer

The presentation layer is the user interface through which students and administrators interact with the application.

It includes:

- Student registration page.
- Login page.
- Student dashboard.
- Course listing page.
- Enrollment page.
- Admin dashboard.

- Course management page.
- Student record management page.

The interface is designed to provide simple navigation and easy access to the required functions.

2. Application Layer

The application layer handles the system's business logic and processes user requests.

Its responsibilities include:

- Validating registration details.
- Processing login requests.
- Managing student information.
- Handling course operations.
- Processing enrollment requests.
- Retrieving and updating records.
- Controlling access based on user roles.

3. Database Layer

The database layer stores and manages the information used by the application.

It contains:

- Student records.
- User credentials.
- Course information.
- Enrollment records.

- Related system data.

The database supports organized storage, retrieval, and updating of information.

3.5 Module Design

The proposed system is divided into individual modules to simplify development and maintenance.

3.5.1 Student Registration Module

This module allows new students to register by providing their personal and academic information.

The registration form collects details such as student name, email address, contact number, student ID, and department.

The submitted information is validated and stored in the database for future use.

3.5.2 Login and Authentication Module

This module provides secure access to the application.

Students and administrators can log in using their registered credentials. The system verifies the entered details and provides access to the appropriate dashboard based on the user's role.

3.5.3 Student Management Module

This module allows administrators to manage student information.

The administrator can view student records, retrieve details, and update information when necessary.

It helps maintain accurate and organized student records.

3.5.4 Course Management Module

The course management module enables administrators to maintain course information.

The main operations include:

- Adding new courses.
- Viewing available courses.
- Updating course details.
- Removing courses when required.
- Maintaining course descriptions and codes.

4. Project Planning Phase

4.1 Introduction

The Project Planning Phase is an essential stage in the Software Development Life Cycle (SDLC), where the activities, resources, schedule, and responsibilities required for successful project development are identified and organized. This phase establishes a clear roadmap for completing the project within the available time and resources.

The Student Enrollment & Course Management System aims to simplify student registration, course administration, and enrollment activities through a centralized digital platform. To achieve these objectives, proper planning is required to organize the development process, identify the necessary tools, allocate time for individual modules, and ensure that the project meets its intended requirements.

During this phase, the project scope, objectives, development methodology, resource requirements, task schedule, potential risks, and testing activities are planned.

The main purpose of project planning is to ensure that the development process is systematic, manageable, and aligned with the requirements identified during the analysis phase.

4.2 Objectives of Project Planning

The primary objectives of the project planning phase are:

1. To define the scope and boundaries of the project.
2. To identify the major activities involved in development.
3. To prepare a realistic project schedule.
4. To identify the hardware and software resources required.
5. To organize the project into manageable modules.
6. To identify possible risks and prepare preventive measures.
7. To plan testing and quality assurance activities.
8. To ensure effective utilization of available time and resources.
9. To establish a systematic approach for project implementation.

4.3 Project Scope

The scope of the Student Enrollment & Course Management System defines the functions and activities covered by the proposed application.

The system focuses on managing student information, course details, and enrollment records through a centralized platform.

Included in the Project Scope:

Student Registration: Students can register by providing personal and academic details.

User Authentication: Registered users can access the application through a login interface.

Student Management: Administrators can view and manage student information.

Course Management: Administrators can add, update, view, and delete course details.

Course Viewing: Students can browse available courses and access relevant information.

Student Enrollment: Students can select and enroll in available courses.

Enrollment Record Management: The system maintains records connecting students with their selected courses.

Database Management: Student, course, and enrollment information is stored in a structured database.

Dashboard: Students and administrators can access relevant functions through their respective dashboards.

Outside the Basic Project Scope:

The following advanced features are not included in the basic project scope unless separately implemented:

- Online fee payment.
- Automated timetable generation.
- Attendance tracking.
- Examination and result management.

- Integration with external university portals.
- Automated SMS notifications.

4.4 Project Development Methodology

The project follows a structured Software Development Life Cycle approach to organize the development activities.

The major phases include:

1. Brainstorming and Ideation.
2. Requirement Analysis.
3. Project Planning.
4. Project Design.
5. System Development and Implementation.
6. Testing and Validation.
7. Deployment and Documentation.

Each phase contributes to the development of a functional and organized application.

The development process begins with identifying the problems and requirements, followed by designing the system architecture and database. The application is then developed module by module and tested to verify that the implemented features work as expected.

4.5 Project Task Breakdown

The project is divided into smaller tasks to simplify development and monitor progress.

Task No.	Project Activity	Description
1	Topic Selection	Finalization of project title and objectives
2	Requirement Analysis	Identification of user and system requirements
3	Project Planning	Scheduling and resource identification
4	System Design	Architecture, database, and interface design
5	Frontend Development	Development of user interface pages
6	Backend Development	Implementation of application logic
7	Database Development	Creation of student, course, and enrollment tables
8	Module Integration	Connecting individual modules
9	Testing	Verification of system functionality
10	Documentation	Preparation of project report

5. Project Development Phase

5.1 Introduction

The Project Development Phase is the stage in the Software Development Life Cycle (SDLC) where the system design and requirements are transformed into a functional software application. During this phase, the planned modules, user

interfaces, database structure, and application logic are developed and integrated to create the proposed system.

The Student Enrollment & Course Management System is developed to simplify student registration, course administration, and enrollment activities through a centralized digital platform. The system provides separate functionalities for students and administrators to manage academic information efficiently.

The development process involves creating the frontend interface, implementing backend operations, establishing database connectivity, developing individual modules, and integrating all components into a single application.

The main objective of this phase is to develop a functional, user-friendly, and organized system that reduces manual work and supports efficient management of student and course information.

5.2 Objectives of the Development Phase

The primary objectives of the project development phase are:

1. To convert the approved system design into a working application.
2. To develop user-friendly interfaces for students and administrators.
3. To implement student registration and login functionalities.
4. To develop course management and enrollment modules.
5. To establish database connectivity for storing and retrieving information.
6. To integrate individual modules into a centralized system.
7. To implement input validation and appropriate error handling.

8. To ensure that the application performs the required operations accurately.
9. To prepare the developed application for testing and validation.

5.3 Development Environment

The development environment consists of the hardware and software tools used to create, execute, and test the application.

The system can be developed using the following technologies:

Component	Technology
Operating System	Windows / Linux
Frontend	HTML, CSS, JavaScript
Backend	Selected server-side technology
Database	Selected database management system
Code Editor	Visual Studio Code
Web Browser	Google Chrome / Microsoft Edge

The frontend provides the user interface, the backend processes application requests, and the database maintains student, course, and enrollment records.

Note: Replace the backend and database entries with the actual technologies used in your project.

5.4 Development Methodology

The project follows a modular development approach in which the application is divided into smaller functional units.

Each module is developed and verified individually before being integrated into the complete system.

The development process includes:

1. Creating the project structure.
2. Designing the user interface.
3. Developing student registration and authentication.
4. Implementing student record management.
5. Developing course management functionalities.
6. Implementing course viewing and enrollment.
7. Creating and connecting database tables.
8. Integrating the modules.
9. Performing initial functional verification.
10. Preparing the application for final testing.

This approach helps organize the development process and makes debugging and maintenance easier.

5.5 Frontend Development

Frontend development focuses on creating the visual components through which users interact with the application.

The interface is designed to provide simple navigation, clear information, and easy access to the required functions.

The major frontend components include:

1. Home Page

The home page introduces the Student Enrollment & Course Management System and provides navigation to the login and registration sections.

2. Student Registration Page

This page contains input fields for collecting student information, including:

- Student name.
- Student ID.
- Email address.
- Contact number.
- Department.
- Password.

The page is designed to collect the required details in an organized format.

3. Login Page

The login page allows registered users to enter their credentials and access the application.

4. Student Dashboard

The student dashboard provides access to course viewing, enrollment, and student information.

6. Project Testing Phase

6.1 Introduction

The Project Testing Phase is an essential stage in the Software Development Life Cycle (SDLC), where the developed application is examined to identify errors, verify functionality, and ensure that the system meets the specified requirements.

The Student Enrollment & Course Management System is designed to simplify student registration, course management, and enrollment activities through a centralized digital platform. Testing is performed to verify that all modules operate correctly and that information is stored, retrieved, and updated accurately.

During this phase, different testing techniques are applied to evaluate the functionality, usability, reliability, and performance of the application. The testing process focuses on identifying defects, correcting errors, and confirming that the system performs its intended operations.

The main objective of this phase is to ensure that the proposed system provides accurate results, maintains data consistency, and offers a user-friendly experience for students and administrators.

6.2 Objectives of the Testing Phase

The primary objectives of the testing phase are:

1. To verify that all system modules function according to the requirements.
2. To identify and correct errors in the application.
3. To validate student registration and login functionalities.
4. To ensure that course management operations work correctly.

5. To verify the accuracy of student enrollment records.
6. To check database connectivity and data consistency.
7. To evaluate the usability of the user interface.
8. To ensure that unauthorized users cannot access restricted functions.
9. To confirm that the system meets the expected functional requirements.

6.3 Testing Methodology

The testing process follows a systematic approach to verify the application at different levels.

The major testing activities include:

- Unit Testing
- Integration Testing
- Functional Testing
- System Testing
- Validation Testing
- Usability Testing
- Security Testing
- Regression Testing

Each testing activity focuses on a specific aspect of the application to identify defects and improve overall system quality.

6.4 Types of Testing

6.4.1 Unit Testing

Unit testing involves testing individual modules separately to verify that each component performs its intended function.

The following modules are considered for unit testing:

Student Registration Module: Checks whether student details are accepted and stored correctly.

Login Module: Verifies whether valid credentials allow access and invalid credentials are rejected.

Course Management Module: Checks whether administrators can add, update, view, and delete course information.

Enrollment Module: Verifies whether students can select courses and whether enrollment details are recorded correctly.

Database Module: Checks whether information is stored and retrieved accurately.

Unit testing helps identify errors within individual components before integration.

6.4.2 Integration Testing

Integration testing verifies the interaction between different modules of the application.

The main integration activities include:

- Connecting the registration form with the student database.
- Connecting the login module with authentication functionality.
- Integrating course management with the course database.

- Connecting course selection with enrollment records.
- Integrating dashboards with the relevant modules.

The purpose of integration testing is to ensure that information flows correctly between the frontend, backend, and database.

6.4.3 Functional Testing

Functional testing verifies whether the application performs the operations specified in the requirements.

The following functions are tested:

1. Student registration.
2. User login.
3. Student record viewing.
4. Course creation.
5. Course updating.
6. Course deletion.
7. Course viewing.
8. Student enrollment.
9. Enrollment record viewing.
10. Input validation.

Functional testing confirms that the system behaves according to its intended functionality.

7. Project Documentation Phase

7.1 Introduction

The Project Documentation Phase is an important stage in the Software Development Life Cycle (SDLC), where all information related to the development, design, implementation, and testing of the application is systematically recorded.

Documentation provides a detailed description of the project, including its objectives, requirements, system architecture, modules, database structure, development process, and testing procedures. It serves as a reference for understanding how the system was designed, developed, and operated.

The Student Enrollment & Course Management System is developed to simplify student registration, course management, and enrollment activities through a centralized digital platform. Proper documentation is necessary to explain the functionality of the system and provide a clear understanding of its technical and operational aspects.

During this phase, the information collected from the previous project stages is organized into a structured project report. Screenshots, diagrams, database details, module descriptions, and testing results are included wherever applicable.

The main objective of this phase is to prepare complete and understandable documentation that describes the proposed system and supports its future maintenance and enhancement.

7.2 Objectives of Project Documentation

The primary objectives of the documentation phase are:

1. To maintain a complete record of the project development process.

2. To describe the purpose and functionality of the proposed system.
3. To document the functional and non-functional requirements.
4. To explain the system architecture and module structure.
5. To provide details about the database design and relationships.
6. To document the technologies and tools used for development.
7. To record the testing procedures and test results.
8. To provide a reference for future maintenance and modifications.
9. To present the project in a clear and systematic format for academic evaluation.

7.3 Documentation Structure

The project documentation is organized into different sections to explain the system from its initial planning stage to its final implementation.

The major sections include:

1. Introduction

This section introduces the Student Enrollment & Course Management System, explains the background of the project, identifies the existing problems, and describes the purpose of developing the proposed application.

2. Problem Statement

This section explains the difficulties associated with traditional student registration and course management processes, including manual record maintenance, data duplication, time consumption, and challenges in retrieving information.

3. Objectives

This section defines the major goals of the system, such as simplifying student registration, organizing course information, maintaining enrollment records, and reducing administrative workload.

4. Existing System

This section describes the traditional methods used for student enrollment and course management and identifies their limitations.

5. Proposed System

This section explains how the proposed digital application addresses the identified problems through centralized student records, course management, and enrollment functionalities.

6. Requirement Analysis

This section documents the functional requirements, non-functional requirements, user requirements, hardware requirements, and software requirements.

7. System Design

This section explains the system architecture, module design, database structure, entity relationships, user interface design, and data flow.

8. System Development

This section describes the development environment, technologies, implementation approach, and development of individual modules.

9. Testing

This section documents the testing methodology, test cases, expected results, actual results, identified defects, and corrective actions.

10. Conclusion and Future Enhancement

This section summarizes the completed project and identifies possible improvements that can be introduced in future versions.

7.4 Documentation of System Modules

Each module of the Student Enrollment & Course Management System is documented separately to explain its purpose, functionality, and role within the application.

1. Student Registration Module

This module allows students to register by entering their personal and academic details.

The documentation includes the registration form fields, validation rules, and database storage process.

2. Login and Authentication Module

This module provides access to registered users through credential verification.

The documentation explains the login process and access permissions for students and administrators.

3. Student Management Module

This module enables administrators to view and manage student information.

The documentation describes the operations used to maintain student records.

4. Course Management Module

This module allows administrators to add, view, update, and delete course details.

The documentation includes the course information fields and management operations.

5. Course Viewing Module

This module allows students to view available courses and their relevant details.

The documentation explains how course information is presented to users.

6. Student Enrollment Module

This module allows students to select and enroll in available courses.

The documentation describes the enrollment process and the storage of student-course relationships.

7. Enrollment Management Module

This module provides administrators with access to student enrollment records.

The documentation explains how enrollment information is maintained and retrieved.

8. Dashboard Module

This module provides centralized navigation to the major application functions.

The documentation describes the student and administrator dashboards and their respective features.

8. Project Demonstration Phase

8.1 Introduction

The Project Demonstration Phase is an important stage in the development of the Student Enrollment & Course Management System. In this phase, the developed system is presented to the project guide, faculty members, evaluators,

and other relevant users to explain its purpose, features, workflow, and expected benefits.

The main objective of the demonstration is to show how the system supports student enrollment and course management through a structured and user-friendly interface. It provides an opportunity to explain the major modules, demonstrate important operations, and present the results of the development and testing activities.

The demonstration also helps evaluators understand how the proposed system addresses common problems in manual student enrollment and course administration, such as maintaining records, checking course details, managing enrollment information, and retrieving student data.

8.2 Objectives of the Project Demonstration

The major objectives of the demonstration phase are:

1. To introduce the Student Enrollment & Course Management System and explain its purpose.
2. To demonstrate the major modules and their functions.
3. To explain the workflow followed by students and administrators.
4. To show how student, course, and enrollment information is organized.
5. To demonstrate the system's interface and navigation.
6. To explain how the system reduces repetitive manual work.
7. To present the testing activities and expected system outcomes.
8. To collect feedback and suggestions from the project guide and evaluators.
9. To identify possible improvements for future development.

8.3 Preparation for Demonstration

Proper preparation is necessary to ensure that the project demonstration is clear, organized, and completed within the available time.

The following activities are carried out before the demonstration:

8.3.1 System Preparation

The application should be opened and checked before the presentation. All required modules should be accessible, and the database should contain suitable sample records for demonstration purposes.

Sample data may include:

- Student details
- Course information
- Enrollment records
- Administrator account details, if applicable

Only fictional or approved sample data should be used during the demonstration to protect personal information.

8.3.2 Interface Verification

The main pages and navigation options should be checked to ensure that they are displayed correctly. Forms, buttons, menus, and messages should be reviewed before the presentation.

8.3.3 Demonstration Sequence

A clear sequence should be prepared so that the system can be explained without unnecessary repetition. The demonstration should begin with the project introduction and proceed through the major operations of the system.

8.3.4 Presentation Materials

The following materials may be prepared:

- Project presentation slides
- System architecture diagram
- Use-case or workflow diagram
- Database design or ER diagram
- Screenshots of important screens
- Sample test cases and results
- Project report

8.4 Demonstration of the System

The demonstration begins with a brief introduction to the project and continues with the major modules of the Student Enrollment & Course Management System.

8.4.1 Project Introduction

The project title, purpose, and problem statement are explained first.

The system is designed to organize student information, course details, and enrollment records in a centralized application. It aims to provide a structured process for managing student enrollment and course-related information.

The existing manual approach may involve paper forms, spreadsheets, and separate records. The proposed system provides a digital method for storing, managing, and retrieving relevant information.

8.4.2 Login and Access

If the system includes login functionality, the demonstration can begin by showing the login page.

The presenter explains how authorized users access the application. If different roles are supported, such as student and administrator, the available functions for each role are briefly introduced.

The login process should be demonstrated using a test account rather than personal credentials.

8.4.3 Student Management Module

The Student Management Module is demonstrated by showing how student information is recorded and maintained.

Typical information may include:

- Student ID
- Student name
- Contact details
- Email address
- Department or programme
- Year or semester

The presenter can explain how student records are added, viewed, updated, or searched, depending on the functions supported by the developed system.
